KENNETH L. FRAZIER

Colo. or a little to the south.

I live almost due east about 180 mi. by air and I looked to the south a little to be able to get sight of object.

This object was also witnessed by my son who was with me at the time.

I saw the smoke cloud left by so called meteor which exploded over at Norton_Kans. This object was not a bright ball of fire like it was.

The silver streak in the sky traveled as if it were a long connected streak. This did not resemble a line of smoke left by a train traveling along it moved altogether as a unit. If it is not against any regulation and if possible would like to have answer to this object.
