fla

my theory of the flying saucer is:

It gets its power from electricity generated by a gen generator. The generator is run from a revolving disc, therefore giving the flying saucers a disc like appearance.

Flying Discs

By the use of gears the revolving disc is able to generate 10 or 20 times more power than is needed.

The faster the disc goes, the more power. By use of the new light weight electric motors, there is less weight, and less space taken.

The revolving disc is in side of light shell. Forward motion of ships allows disc to revolve, generating elect power.

This way, the flying disc could fly almost any length of time. Compressed air could be used to start power disc.
