

Whatever means of power these objects possess, they may attain speeds far in excess of our latest rockets. It will be futile to give pursuit, or to attempt any forceful approach.

From reports, we have no reason to believe these objects have anything but friendly intentions, also, they may be restricted as to the distance they may approach the earth without danger. It is also my belief that given an opportunity, they will approach an earthly object, at high altitude, as close as possible without danger to either themselves or the object.

If my theory approaches the truth, then these strange objects will be unable to establish contact with the earth without our assistance.

Taking the earth at an age of two billion years, having suffered worldly catastrophies, and set-backs, we may be as children compared to a planet of four billion years, or of equal age without catastrophies.

Our scientific laws have worked well for us, however, they probably do not hold true for all planets. Lacking water and trees in the beginning we would have been an entirely different world, perhaps even further advanced.

My background includes a good foundation in high-altitude flying, and in the field of electricity. Although I am well established in business, it is my desire to enter the field of research related to this subject.

My name is not for publication.

Very truly yours,

*W. B. Burgess*
