

THE FIRST PHOTOGRAPHS OF A "FLYING SAUCER", OBTAINED IN TURANGA AT AN ALTITUDE OF 9000 FEET

(Caption under photographs)

Mr. Norman Horacio Godwin, a student of the National School of Engineering, is one of the thousands of persons who have seen "with their own eyes" the flying saucers or disks which have become the general topic of commentaries and have given rise to the most varied hypotheses. It is at this time that the young man himself is the first to have photographed these strange apparatuses. He observed one of them and was able to take the picture against the sky of Turanga. The picture of the "flying saucer" at an altitude of 9000 to 10000 feet above the streets of Turanga. The apparatus seems to be a double-trimmed cone, joined at its base which moves by something like jet propulsion and which displaced itself by changing position in order to use its motive force in the direction desired. For which reason it can be seen under apparently different forms. 2. Construction of Mr. Godwin's, concerning the real form of the strange mechanical objects drawn by him. 3. Another aspect of the flying saucer. 4. The future civil engineer, Horacio Godwin, sketched in our editorial office after having reported his observations on the flying disk and after having handed over the pictures of the apparatus which he had obtained.

(See with five drawings is entitled "Wings and Propellers"
